Implants for Life

# The freedom to smile

A smile opens doors and builds trust, for the person who smiles and the person who sees it. It improves social relationships. Healthy teeth are synonymous with positive thinking, vitality, trust and self-confidence.

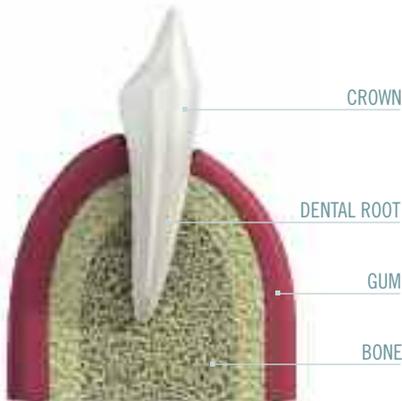

**But it is not just a question of appearance...**

**The beauty of a smile is linked to function:** teeth are essential to nutrition and consequently to health. Scientific studies show that healthy teeth have a considerable influence on a person's wellbeing.

Loss of teeth, generally has a negative impact on a person's quality of life. It affects nutrition, digestion, speech, self esteem and social relations, wiping the smile off a person's face.

Today, thanks to scientific studies and clinical results from over 40 years of implantology, missing teeth can be replaced simply and permanently to bring back your smile.

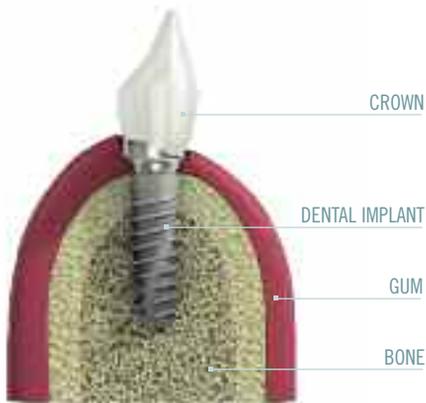

# What is a dental implant?

A natural tooth consists of a dental crown and a root. The crown is the visible part of the tooth, while the root is embedded in the bone and provides stability.

The loss of a tooth beside the esthetic and functional harm it causes, can produce bone atrophy due to the lack of support provided by the root.

A dental implant is the most advanced way to replace a tooth and yet, the most natural.

The dental implant replaces the bone root: it is made of titanium, a highly biocompatible material which is perfectly suited for naturally integrating with the bone.

Afterwards, a crown made by specialists in a dental laboratory is fixed onto the implant.

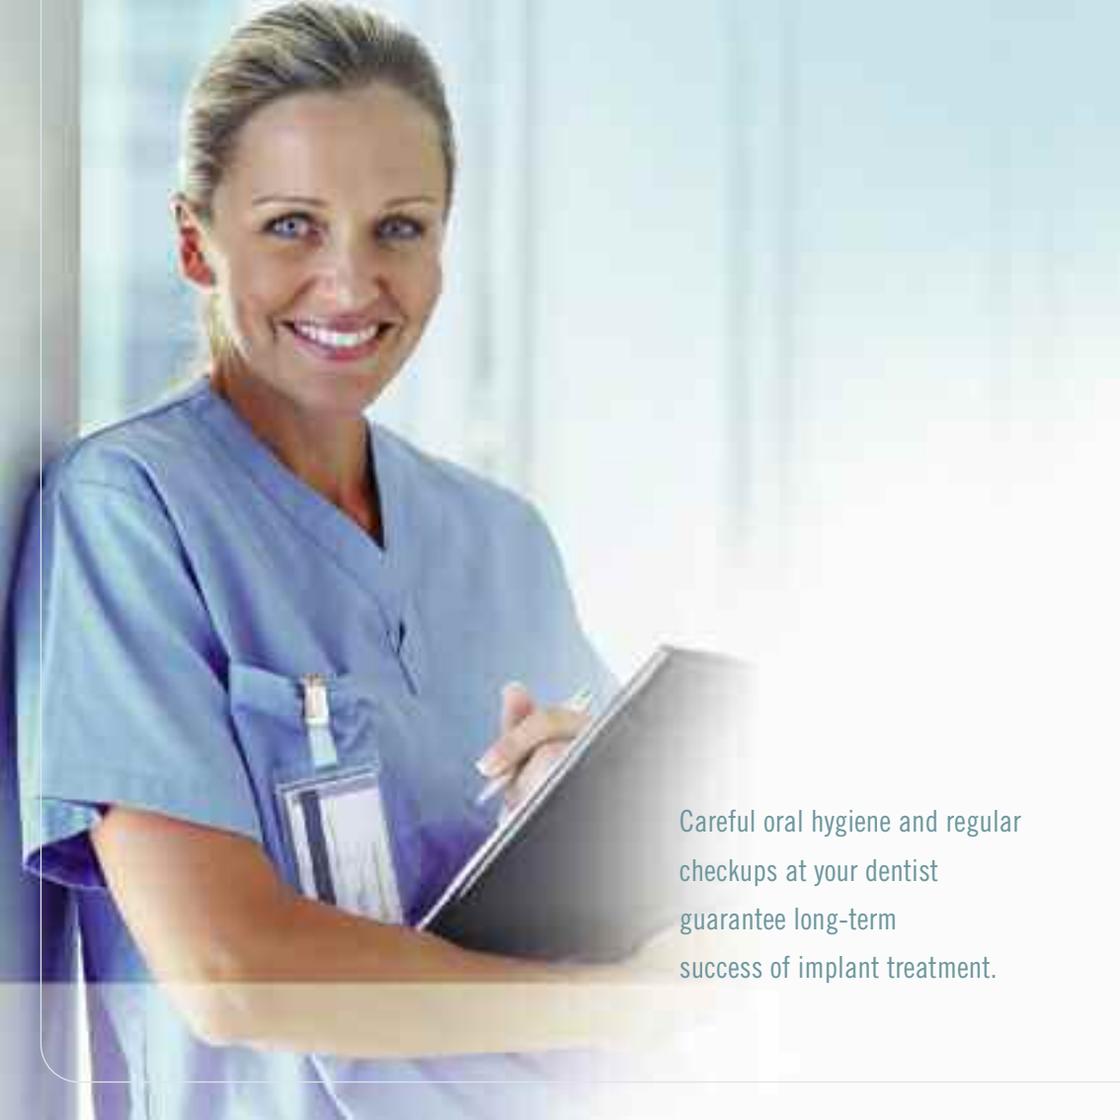

Nothing more closely resembles a natural tooth in esthetic, functionality and hygiene.

# The advantages of dental implants

- They are a functional and an attractive solution
- They are practically indistinguishable from a natural tooth
- They eliminate the typical disadvantages of false teeth
- They prevent bone atrophy by transmitting normal chewing loads to the bone

In recent years, the use of dental implants has become the ideal solution for replacing missing teeth, as it has none of the disadvantages of traditional prosthetics.

Careful oral hygiene and regular checkups at your dentist guarantee long-term success of implant treatment.

# Treatment with implants

After a careful diagnosis and detailed planning of the treatment, the implants are inserted in the maxillary or mandibular bone in a minimally invasive intervention with local anaesthetic.

This intervention is followed by a healing period that can last from 3 to 6 months, during which the bone grows and strengthens around the implant, creating optimum stability.

Once the healing period is over, the definitive tooth is screwed or cemented onto the implant abutment.

In some cases, the initial stability of the implant is good enough to permit a provisional tooth to be placed on the implant immediately after the intervention (immediate loading).

# Treatment options

REPLACEMENT OF A SINGLE TOOTH

REPLACEMENT OF ONE OR MORE TEETH

REPLACEMENT OF A FULL DENTAL ARCH

# Costs

There is no general rule to define the cost of implant treatment. This basically depends on the condition of the patient's oral cavity and the type of treatment planned. Your dentist will tell you which is the most appropriate treatment for your specific case and what will be the cost.

Implant treatment generally involves a greater initial investment compared to treatment with conventional prosthetics. Despite this, it is still cheaper in the long term, as with careful oral hygiene and regular checkups, it is a definitive solution for deteriorated or missing teeth.

Scientific studies show that 95% of dental implants are still working perfectly well 10 years after insertion.

J DENTAL CARE

JDentalCare® implants have been designed with a look towards the future, because it is your future smile that we are thinking of.

# Why choose JDentalCare®

JDentalCare® is an Italian company that has made innovation its main source of inspiration.

JDentalCare® products are developed in close collaboration with dentists at the cutting edge of dental implantology, with the permanent goal of providing patients with a longer-lasting result and maximum comfort.

JDentalCare® dental implants are designed in line with the latest developments in the field of oral implantology, considering all its aspects, from implant morphology, to biocompatibility, to functional simplicity that covers the widest variety of treatments possible.

The care JDentalCare® places into studying state-of-the-art solutions, the rigour of its scientific research and the constant attention it pays to its product controls all go to guarantee quality for the patient.

“Just smile” is the message we give  
to our patients, because,  
in the end, smiling is simple.
